ABOUT

Developer with expertise in Core Java, Python, Spring Boot, and microservices. Skilled in designing backend systems, REST APIs, and event-driven applications.

CORE TECHNICAL SKILLS

Programming Languages: Java, SQL, HTML, JavaScript, Python

Frameworks & Libraries: React.js, Spring Boot, Spring MVC, Spring Data JPA, Hibernate, Flask, Spring Security(JWT),

Architecture & Design: Microservices Architecture, RESTful Web Services, Object-Oriented Programming (OOPs)

Database Technologies: MySQL, AWS DocumentDB, JDBC

Cloud & DevOps: AWS (EC2, S3, Lambda), Jenkins, CI/CD Pipelines, GitHub Actions

Tools & Build Systems: Eclipse IDE, Git, GitHub, Postman, VSCode

WORK EXPERIENCE

Software Consultant - Coforge

Aug 2025 – Present | Hyderabad, India

- Trained in Java, Spring Boot, Apache Kafka, AWS and ReactJs.
- Worked with REST APIs, Java collections, multithreading, JDBC, Spring Security(JWT)
- Implemented problem-solving tasks, backend logic, and service-layer components as part of training deliverables.

Technical Content Developer – Intern | Cantilever Labs

Jun 2024 – Aug 2024 | Hyderabad, India

- Crafted and reviewed coding challenges focused on data structures, algorithms, problem-solving, and logical reasoning.
- Collaborated with mentors to ensure high-quality content aligned with engineering best practices. Improved clarity, structure, and readability of problem statements for learners.

PROJECTS

Project 1: Jenkins CI/CD – Spring Security JWT Demo

Overview: Designed and implemented a Jenkins CI/CD pipeline for a Java Spring Boot project featuring JWT authentication. Automated build and deployment stages, ensuring continuous integration for Spring Security-enabled applications.

Architecture & Tech Stack used: Spring Boot, Spring Security, JWT, Jenkins, Maven

GitHub: <https://github.com/prabhasg03/Techademy-Assignments/tree/main/5-Assignment-15-10-2025>

Project 2: Telemedicine Platform – Spring Boot Microservices & React

GitHub: https://github.com/prabhasg03/Capstone_Project

Overview: Developed a full-stack telemedicine platform enabling patient registration, doctor login, health data management, and consultation scheduling. Built backend microservices using Spring Boot with Spring Security JWT for endpoint access and implemented email notifications using Java SimpleMailMessage. Designed a responsive frontend with React.js for an intuitive user experience.

Key Features:

- Patient/Doctor registration & secure login
- Appointment booking & consultation workflow
- Health data management (medical records & history)
- REST API integration between React frontend and Spring Boot backend
- Email notifications for appointments and alerts

Tech Stack used: Java, Spring Boot, Spring Data JPA, MySQL, React.js, Axios, Spring Security JWT, Spring Email

Project 3: Internet Banking Application (ATM System)

GitHub: https://github.com/prabhasg03/Internet_Banking_Portal

Overview: The Internet Banking Application is a full-stack web application designed to provide secure and efficient online banking services. It enables users to manage accounts, perform financial transactions such as deposits and withdrawals, and access role-based functionalities

through a modern web interface. The backend is built using Spring Boot with JWT-based authentication and Spring Security, while the frontend is developed using React for a responsive user experience. MySQL is used for persistent data storage.

Key Features:

- JWT-based authentication and role-based authorization (USER, ADMIN)
- Secure password encryption using BCrypt
- Deposit and withdrawal operations with transaction history tracking
- Account balance inquiry and transaction filtering (CREDIT/DEBIT)
- User management including create, update, and delete operations
- Role management with assignment and access control
- RESTful API design with layered architecture
- Protected routes and authentication state management in frontend

Tech Stack: Java, Spring Boot, Spring Security, JWT, React.js, MySQL, Spring Data JPA, Hibernate, Axios, Bootstrap

Project 4: Serverless File Processing System – AWS S3, Lambda, DynamoDB

Overview: Developed a serverless system to automatically process text files uploaded to S3 using a Java Lambda function. The system reads uploaded .txt files, analyzes content, and stores the processing results in DynamoDB, enabling automated file analytics with minimal manual intervention. It also logs errors in CloudWatch for monitoring

Key Features:

- **Data Persistence:** Stores results in DynamoDB table (FileProcessingResults) with metadata (fileName, lineCount, wordCount, charCount, preview, processedDate)
- **IAM Role Management:** Secure access to S3 and DynamoDB resources for Lambda execution

Tech Stack used: Java 17, AWS Lambda, S3, DynamoDB, IAM Roles, Maven, AWS SDK v2
